

Thermodynamics of \overline{TT} -bar deformed $O(N)$ vector model

Wednesday, 16 December 2020 16:00 (20 minutes)

We investigate an irrelevant deformation of 2D quantum field theories, called “ \overline{TT} -bar deformation”. Although this is known as an integrable deformation, its quantum aspects have not been completely understood yet. For example, \overline{TT} -bar deformation of the free massless $O(N)$ vector model is said to be Nambu-Goto action in the static gauge. In this talk, we compute the thermal free energies in both theories, and discuss the equivalence between \overline{TT} -bar deformed $O(N)$ vector model and Nambu-Goto action at quantum level.

Presenter: Mr HARUNA, Junichi (Kyoto U.)

Session Classification: Short talks
