## Space time evolution of the lepton number densities including the momentum distribution

Friday, 15 March 2024 14:45 (25 minutes)

"We investigate the Space time evolution of the lepton number densities.

The formulation is constructed as the time evolution of a lepton family number density operator.

The expectation value of the density operator is evaluated for the initial state with a Gaussian distribution for the momentum amplitude.

This enables us to study wave-packet-like decoherence effects.

We show in the non-relativistic regime, the type of neutrino mass (Dirac or Majorana) are distinguishable even under the presence of wave-packet-like decoherence effects."

Presenter: MOROZUMI, Takuya (Hiroshima University)
