

New Physics and the Muon $g-2$

Tuesday, 13 February 2018 15:00 (30 minutes)

The ~ 3.5 -sigma discrepancy between the measured value of the muon $g-2$ and the Standard Model prediction could be a signal of new physics. Possible resolutions, originating at both high and low energies, and their phenomenology are discussed.

Presenter: DAVOUDIASL, Hooman (Brookhaven National Laboratory)

Session Classification: Joint Session with Muon $g-2$ Workshop
