## Recent developments on rare B-decays

Thursday, 15 February 2018 11:00 (30 minutes)

After a review of tensions in charged-current and rare B decays and their interpretation in beyond SM scenarios, we focus on some developments that aim to improve theoretical control. Progress on QED corrections to leptonic decays  $B_s \rightarrow mu$  mu and  $B_u \rightarrow mu$  nu has been made, that was required in view of the current accuracy providing in the future precision at the percent level to short-distance quantities. A novel approach to the hadronic charm contribution in rare  $b \rightarrow s$  ll decays builds on a combined analysis of  $b \rightarrow s$  ll and  $b \rightarrow s$  (ccbar)  $b \rightarrow s$  ll decays to separate hadronic contributions from new physics signals.
