

# The Pion Vector Form Factor from Lattice QCD at the physical point

*Friday, 7 August 2020 15:20 (20 minutes)*

We present a Lattice QCD investigation of the pion electromagnetic form factor based on gauge configurations generated by Extended Twisted Mass Collaboration with  $N_f = 2+1+1$  dynamical quark flavors. The calculation is carried out at two different lattice spacing values directly at the physical point. Employing Wilson clover twisted mass fermions at maximal twist guarantees  $O(a)$  improved results. We present a preliminary continuum extrapolation of the form factor and compare to the experiment. In addition, we provide an estimate of the pion charge radius.
